

INSTALLING YOUR NEW SERUM PRESETS, WAVETABLES & NOISES

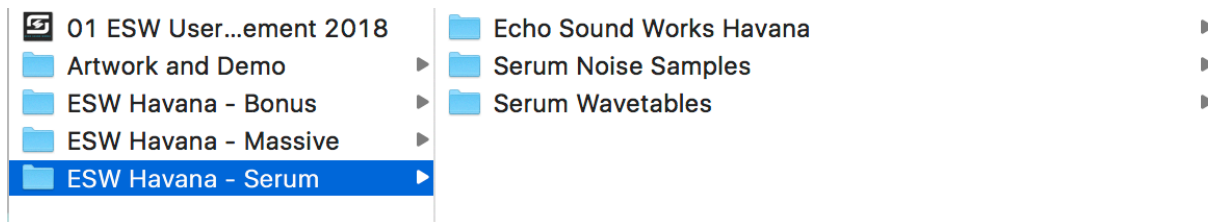

- 1.) Open your DAW of choice, e.g. Logic X, Live, etc.
- 2.) Load up an instance of Serum on a software instrument/MIDI track in your DAW
- 3.) Click Menu in the upper right hand corner of Serum, then select *Show Serum Presets folder*.

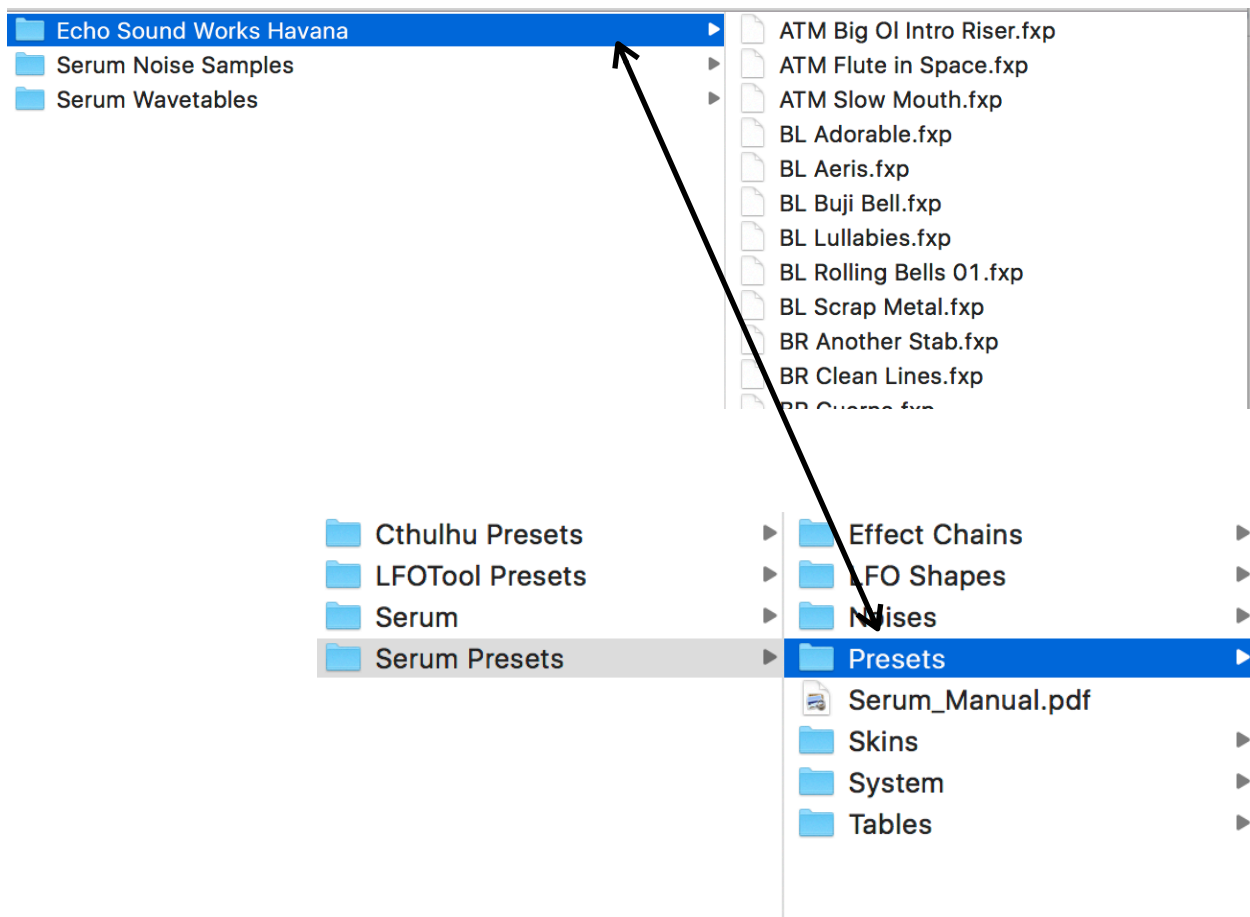

- 4.) A new window will appear and will look similar to this. Keep this window open or near.

5.) Open your new ESW Soundset in your Finder or Explorer and navigate to the folder that says Serum. There will be either 2 or 3 folders depending on the pack.

6.) Take the entire folder that is named after the soundset, in this example it is Havana, and drag and drop it into the Serum folder from step 4 above. Drag it into the Presets folder. There should be files that say .fxp in this folder.

7.) Repeat the process with the noise samples and the wavetables. The noise samples go in the folder titled *Noises* and the wavetables go in the folder titled *Tables*.

8.) Close these windows and go back into your DAW. Open Serum again, click Menu, then click *Rescan Folders On Disc*. You can now access and browse your new presets, wavetables, and noise sounds in Serum.
